Question

A body constrained to move along the z-axis of a coordinate system is subject to a constant force:

$$\mathbf{F} = \begin{pmatrix} -1 \\ 2 \\ 3 \end{pmatrix}$$

What is the work done by this force in moving the body a distance of 4 m along the z-axis?

Answer

Work done in moving an object by a distance \mathbf{s} using an external force \mathbf{F} is given by:

$$W = \mathbf{F}^T \mathbf{s}$$

As seen above, work done is the dot product (scalar product) of Force and distance.

Here,

$$\mathbf{s} = \begin{pmatrix} 0 \\ 0 \\ 4 \end{pmatrix}$$

The scalar product of the variables is given by:

$$\mathbf{F} \cdot \mathbf{s} = (-1 \quad 2 \quad 3) \begin{pmatrix} 0 \\ 0 \\ 4 \end{pmatrix} = 12$$

The work done by the force \mathbf{F} is 12 J
