Question

A body constrained to move along the z-axis of a coordinate system is subject to a constant force:

$$\mathbf{F} = \begin{pmatrix} -1\\2\\3 \end{pmatrix}$$

What is the work done by this force in moving the body a distance of 4 m along the z-axis?

Answer

Work done in moving an object by a distance ${\bf s}$ using an external force ${\bf F}$ is given by:

$$W = \vec{F}.\vec{s}$$

As seen above, work done is the dot product (scalar product) of Force and distance.

Here,

$$\mathbf{s} = \begin{pmatrix} 0 & 0 & 4 \end{pmatrix}$$

The scalar product of the variables is given by:

$$\mathbf{F.s} = \begin{pmatrix} -1\\2\\3 \end{pmatrix} \begin{pmatrix} 0 & 0 & 4 \end{pmatrix} = 12$$

The work done by the force ${\bf F}$ is 12 J
